

Customer Journey Map – ServiceNow

Topic: Import Data using Transform Maps

IMPORT DATA USING TRANSFORM MAPS

SCENARIO

Importing external data into ServiceNow using Import Sets and Transform Maps.

STAGE	Prepare Data	Import Set	Transform	Run Transform	Verify	Complete
Experience	Get CSV/Excel data ready and check required fields.	Create an Import Set and upload the data file.	Create/select a Transform Map and map source fields to target fields.	Run the transform and monitor imported records.	Check target records, errors, and transform history.	Confirm data is correctly imported and available in ServiceNow.
Interactions / Things	Source file, Excel/CSV, data cleanup, field names.	All > System Import Sets > Load Data; upload file; choose table/import set.	Transform Map form; source table; target table; field mappings.	Transform button; import set records; transform log.	Target table/list; imported records; error messages; transform history.	Validated target records; imported data ready for use.
Goal / Motivation	Help me make sure the source data is complete and clean.	Help me bring the external data into ServiceNow safely.	Help me connect each source field to the correct target field.	Help me convert the imported data into usable ServiceNow records.	Help me confirm the import worked without missing or incorrect records.	Help me finish the import with reliable, usable data.
Positive moments	Data is organized and ready.	File uploads successfully.	Field mappings are clear.	Transform completes successfully.	Records appear correctly.	Data is ready for users.
Negative moments	Missing columns or incorrect formats.	Wrong import table or file settings.	Incorrect field mapping can create bad data.	Transform errors or ignored rows.	Duplicate, missing, or incorrect records.	Need to repeat the import because of errors.
Areas of opportunity	Provide a simple data checklist/template.	Show clear file-format and column guidance.	Use clear field mapping names and previews.	Display transform progress and useful error details.	Provide easy validation and duplicate checks.	Offer a final import summary and error report.

Flow: Prepare Data → Create Import Set → Create/Select Transform Map → Run Transform → Verify Records → Complete
