

Project Design Phase-II

Data Flow Diagram & User Stories

Date: 22 September 2026

Team ID	SWTID-2026-6491
Project Name	Import Data using Transform Maps
Maximum Marks	4 Marks

Data Flow Diagram:

A Data Flow Diagram (DFD) is a visual representation of how data moves through the Import Data using Transform Maps process. It shows how source data is uploaded, validated, transformed, mapped to target fields, and stored in the target table.

Example: Simplified DFD

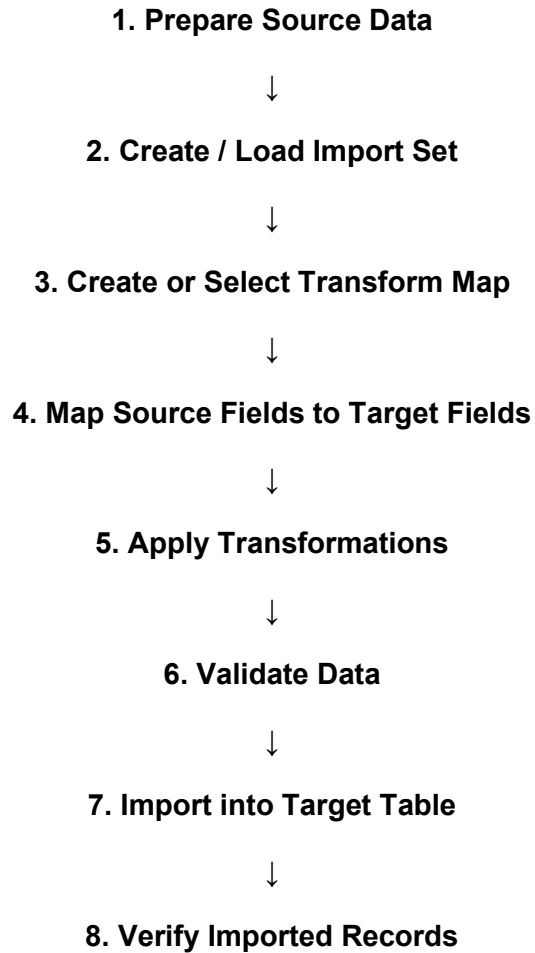

Step	Data Flow	Description
1	Source Data → Import Set	Upload or load the source data into an import set.
2	Import Set → Transform Map	Select the transform map to define how source fields are mapped.
3	Source Fields → Target Fields	Map source fields to the corresponding target table fields.
4	Transform Map → Transform	Apply field mappings and transformation logic.
5	Validation	Check whether the imported data matches the required target format.
6	Target Table	Insert or update records in the target table.

User Stories

Use the below template to list the user stories for the Import Data using Transform Maps process.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Administrator	Import Data	USN-1	As an administrator, I can upload source data into an import set.	I can upload the source file and create an import set.	High	Sprint-1
Administrator	Transform Map	USN-2	As an administrator, I can create or select a transform map for the import set.	I can select the source and target tables for the transform map.	High	Sprint-1
Administrator	Field Mapping	USN-3	As an administrator, I can map source fields to target fields.	Required source fields are mapped to the correct target fields.	High	Sprint-1
Administrator	Transform Data	USN-4	As an administrator, I can apply transformation logic to imported data.	The imported values are transformed according to the defined rules.	Medium	Sprint-2
Administrator	Validate Import	USN-5	As an administrator, I can validate the imported records before completing the import.	Import errors are identified and corrected before records are committed.	High	Sprint-2
Administrator	Target Records	USN-6	As an administrator, I can import the transformed data into the target table.	The transformed records are inserted or updated in the target table.	High	Sprint-2

Import Data using Transform Maps – Process Flow

Expected Outcome

The source data is successfully imported through an import set and transform map, with source fields mapped and transformed into the appropriate target table records.
