

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date: 22 September 2026	Team ID: _____	Maximum Marks: 4 Marks
Project Name: Import Data Using Transform Maps		

Functional Requirements:

Following are the functional requirements of the proposed solution for importing external data into ServiceNow using Transform Maps.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Import Data	Upload/import source data from CSV or other supported data sources.
FR-2	Transform Map Configuration	Create a Transform Map and map source fields to target table fields.
FR-3	Data Transformation	Use field mapping, data transformation rules, and scripts to convert source data into the required target format.
FR-4	Data Validation & Import	Validate imported records, handle errors or duplicate data, and verify that records are created correctly in the target table.

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The Transform Map process should be simple and easy to configure and use.
NFR-2	Security	Imported data should follow ServiceNow access controls and security policies.
NFR-3	Reliability	The import process should consistently create accurate target records without data loss.
NFR-4	Performance	Large data imports should be processed efficiently with acceptable response and processing time.
NFR-5	Availability	The import and Transform Map functionality should be available whenever data migration is required.
NFR-6	Scalability	The solution should support increasing data volumes and additional source-to-target mappings.
